

# Capital Budgeting

FINANCIAL ANALYSIS IN POWER BI

**Nick Edwards**

Capital Markets Analyst

# What is capital budgeting?

**Capital budgeting** is the process of allocating money for new projects that generate cash flows.

- Analysts will estimate the cash flows from the project and give a recommendation
- Budgets are limited, resources are scarce, so many projects are **mutually exclusive**

# Net present value (NPV)

Net present value is the sum of all discounted cash flows.

- Essentially just a series of present value calculations
- **NPV investment criteria**
  - If  $NPV > 0$  then invest
  - If  $NPV < 0$  then don't

$$NPV = \sum_{t=0}^n \frac{CF_t}{(1+i)^t}$$

***where:***

*CF = net cash flow*

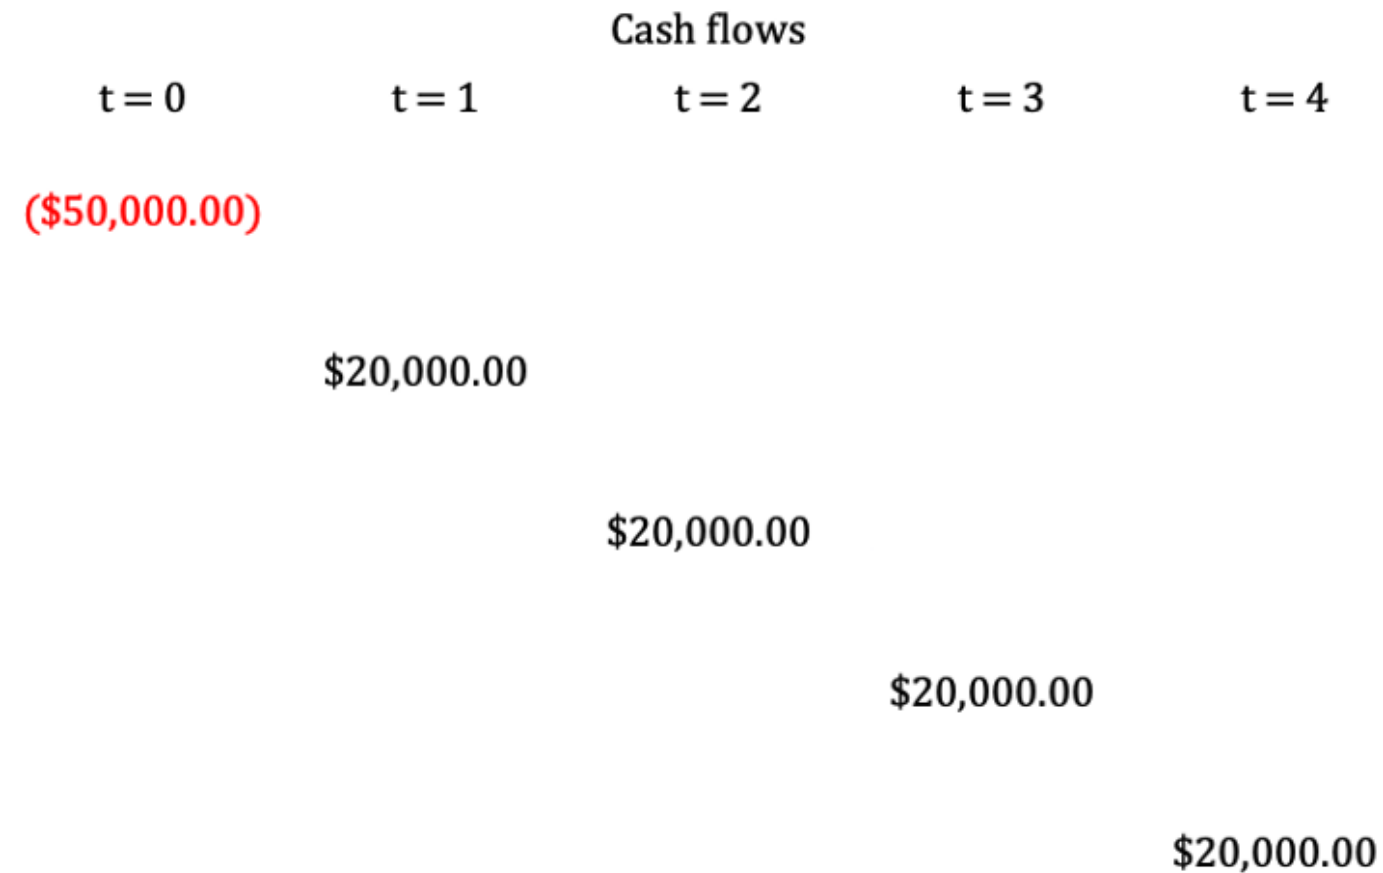

*t = time period*

*i = discount rate*

<sup>1</sup> <https://www.investopedia.com/terms/n/npv.asp>

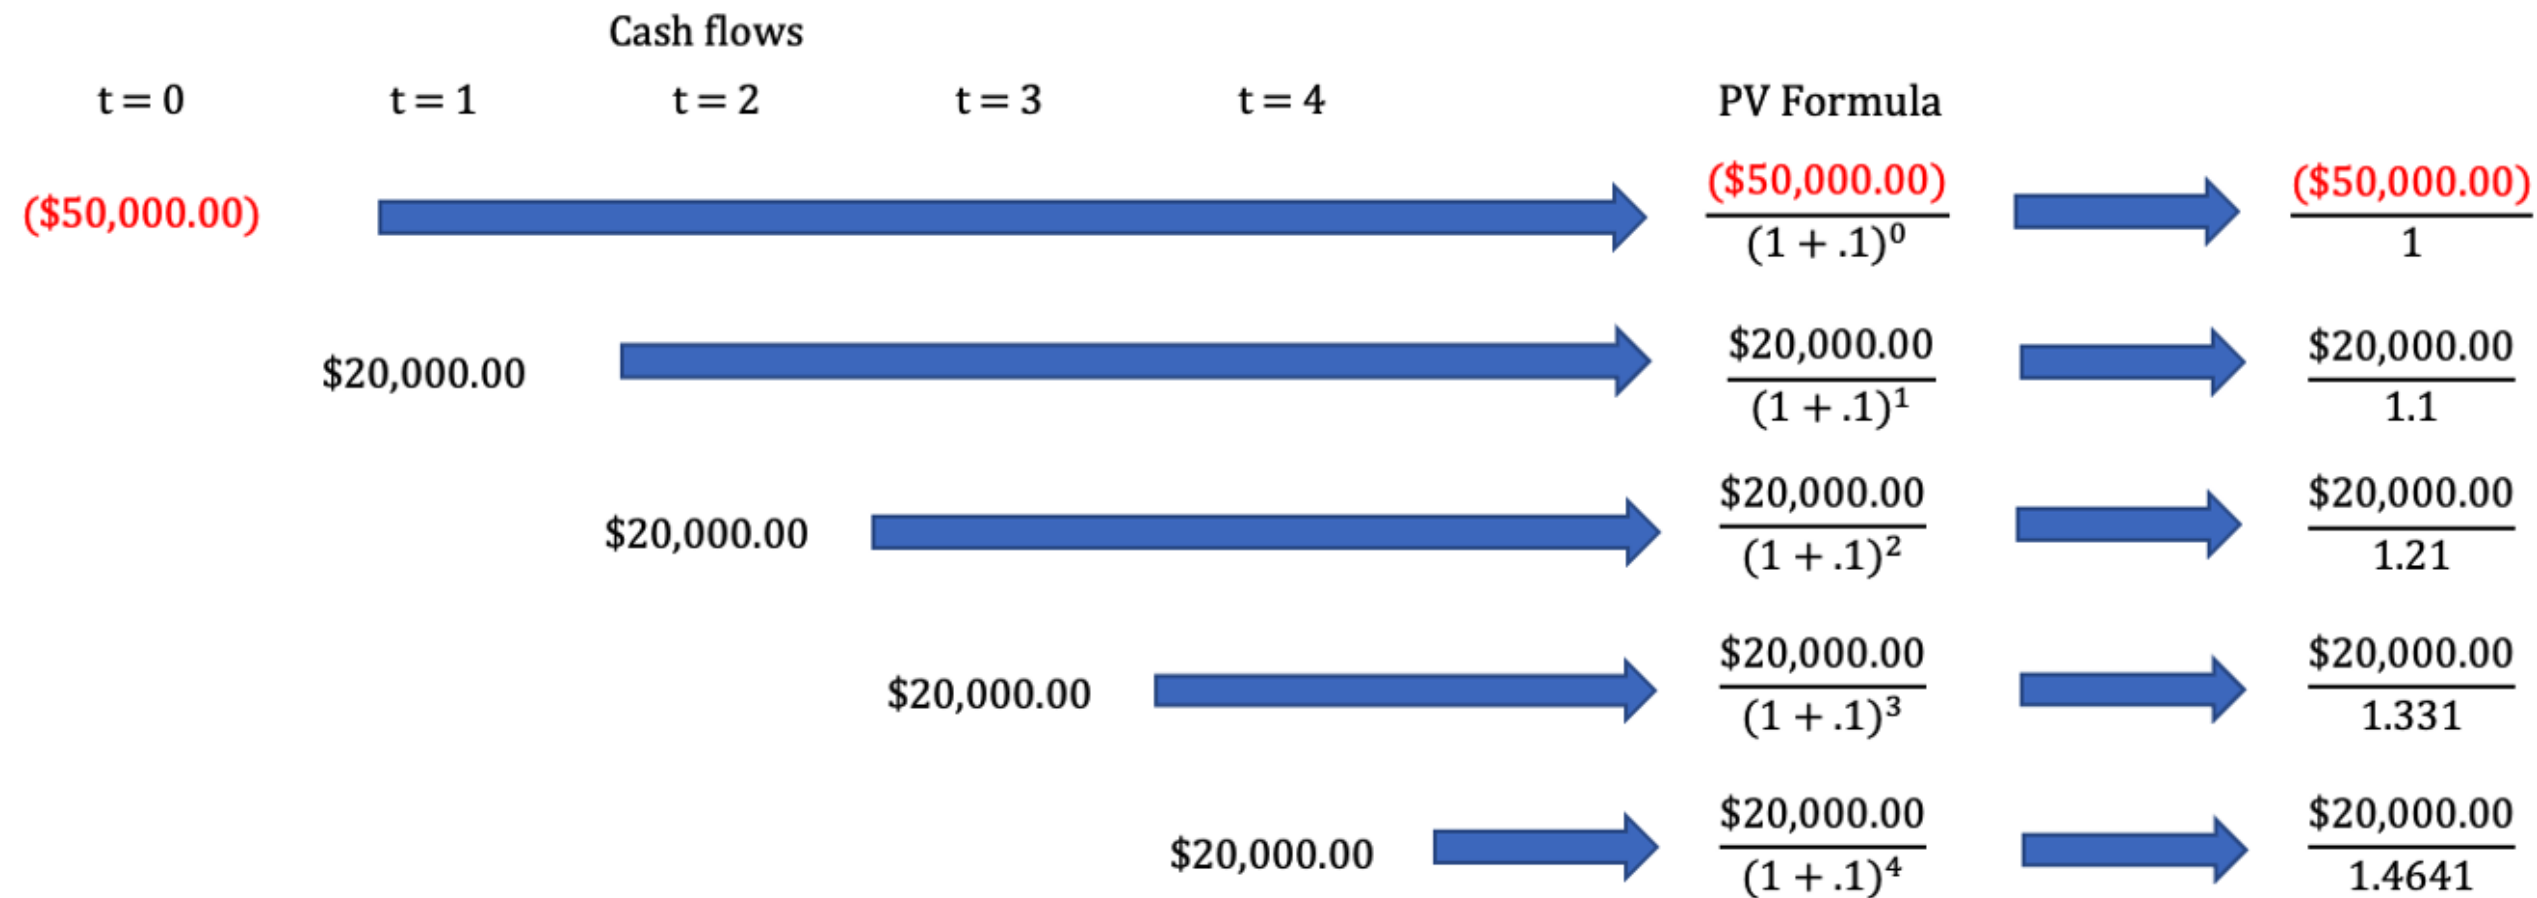

# Net present value (NPV)

**Example:** Should a company invest in this project at a 10% discount rate?

# Net present value (NPV)

**Example:** Should a company invest in this project at a 10% discount rate?

# Net present value (NPV)

**Example:** Should a company invest in this project at a 10% discount rate?

Cash flows					PV Formula		Present Value
t = 0	t = 1	t = 2	t = 3	t = 4			
(\$50,000.00)					$\frac{(\$50,000.00)}{(1 + .1)^0}$		(\$50,000.00)
	\$20,000.00				$\frac{\$20,000.00}{(1 + .1)^1}$		\$18,181.82
		\$20,000.00			$\frac{\$20,000.00}{(1 + .1)^2}$		\$16,528.93
			\$20,000.00		$\frac{\$20,000.00}{(1 + .1)^3}$		\$15,026.30
				\$20,000.00 	$\frac{\$20,000.00}{(1 + .1)^4}$		\$13,660.27
							<hr/> \$13,397.31

# Discount rates and NPV

# Where do discount rates come from...

## Opportunity cost

is the next best alternative return that was given up to pursue the selected project

- i.e. bonds, stocks, other investments

## Cost of capital

is the cost of raising money for the project

- Made up by debt and equity
- **Weighted average cost of capital (WACC)**  
is the combination of the cost of debt and equity

<sup>1</sup> <https://www.investopedia.com/terms/c/costofcapital.asp>

# Profitability index (PI)

- Profitability index is a ratio of NPV that gives dollar earned per dollar spent

$$PI = 1 + \frac{NPV}{Invested\ Amount}$$

- Useful in prioritizing projects when capital is limited
- Anything less than one should not be undertaken (NPV would be negative)

## Example:

$$PI = 1 + (NPV / Invested\ amount)$$

$$PI = 1 + (\$13,397.31 / \$50,000.00)$$

$$PI = 1 + 0.27$$

$$PI = 1.27$$

<sup>1</sup> <https://www.investopedia.com/terms/p/profitability.asp>

# Choosing the right project

Choose the investment with the highest NPV

- "The golden rule"
- NPV represents a real dollar amount

**NPV has its limitations:**

1. Cash flows are estimates
2. Does not consider qualitative risks or business objectives
  - Other metrics can be used depending on the case

# Internal rate of return and payback period

FINANCIAL ANALYSIS IN POWER BI

**Nick Edwards**  
Capital Markets Analyst

# Internal rate of return (IRR)

The internal rate of return is the discount rate that makes NPV zero.

# Internal rate of return (IRR)

The **internal rate of return** is the discount rate that makes NPV zero.

- It is an iterative function
  - "guess-and-check"
  - Not easy to find by hand
- `XIRR()` is used in Power BI
  - Cash flows
  - Dates of cash flows

$$0 = NPV = \sum_{t=0}^n \frac{CF_t}{(1+i)^t}$$

***where:***

*CF = net cash flow*

*t = time period*

*IRR = internal rate of return*

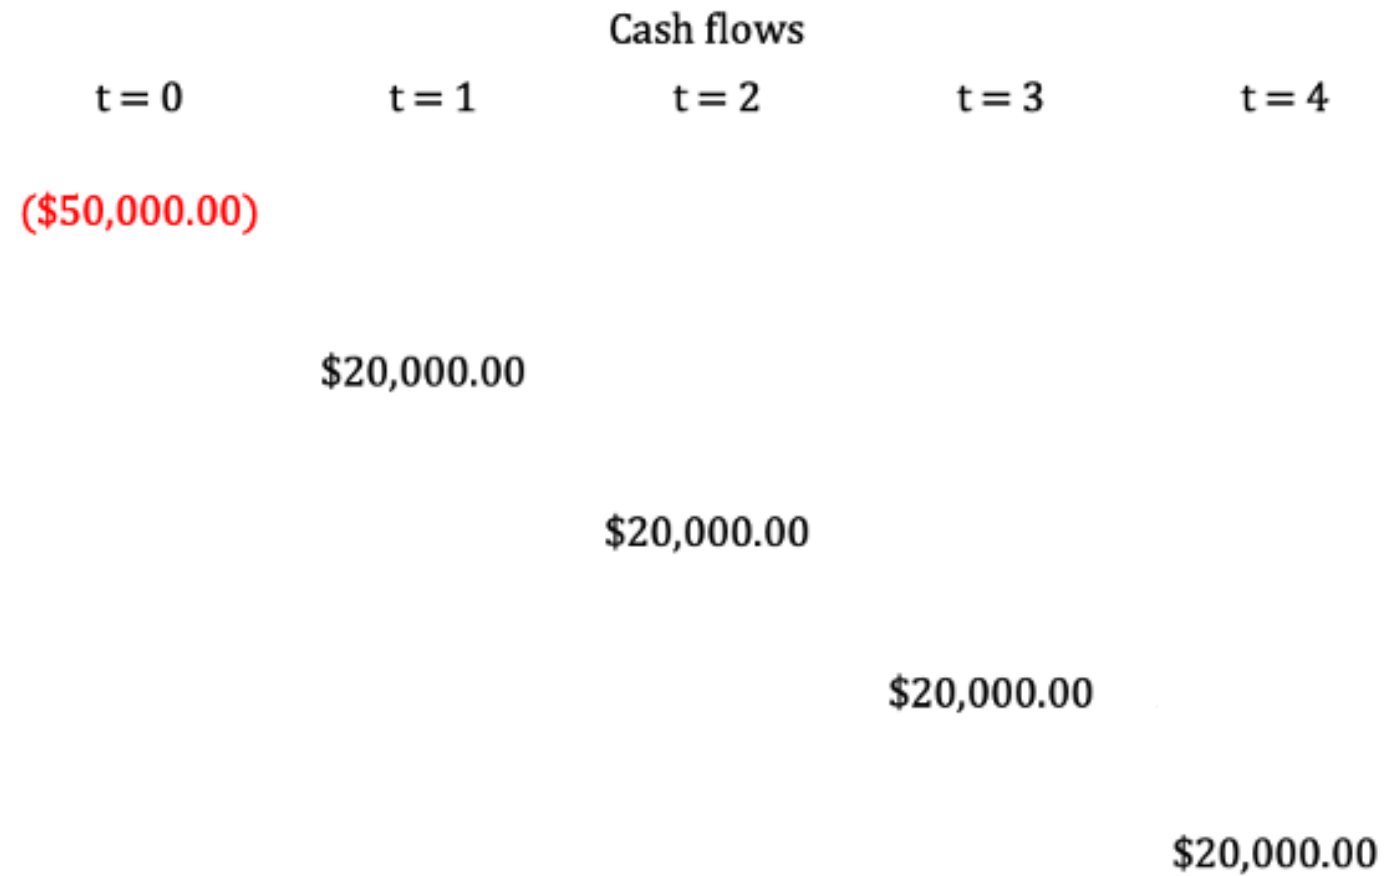

*NPV = net present value*

<sup>1</sup> <https://www.investopedia.com/terms/i/irr>

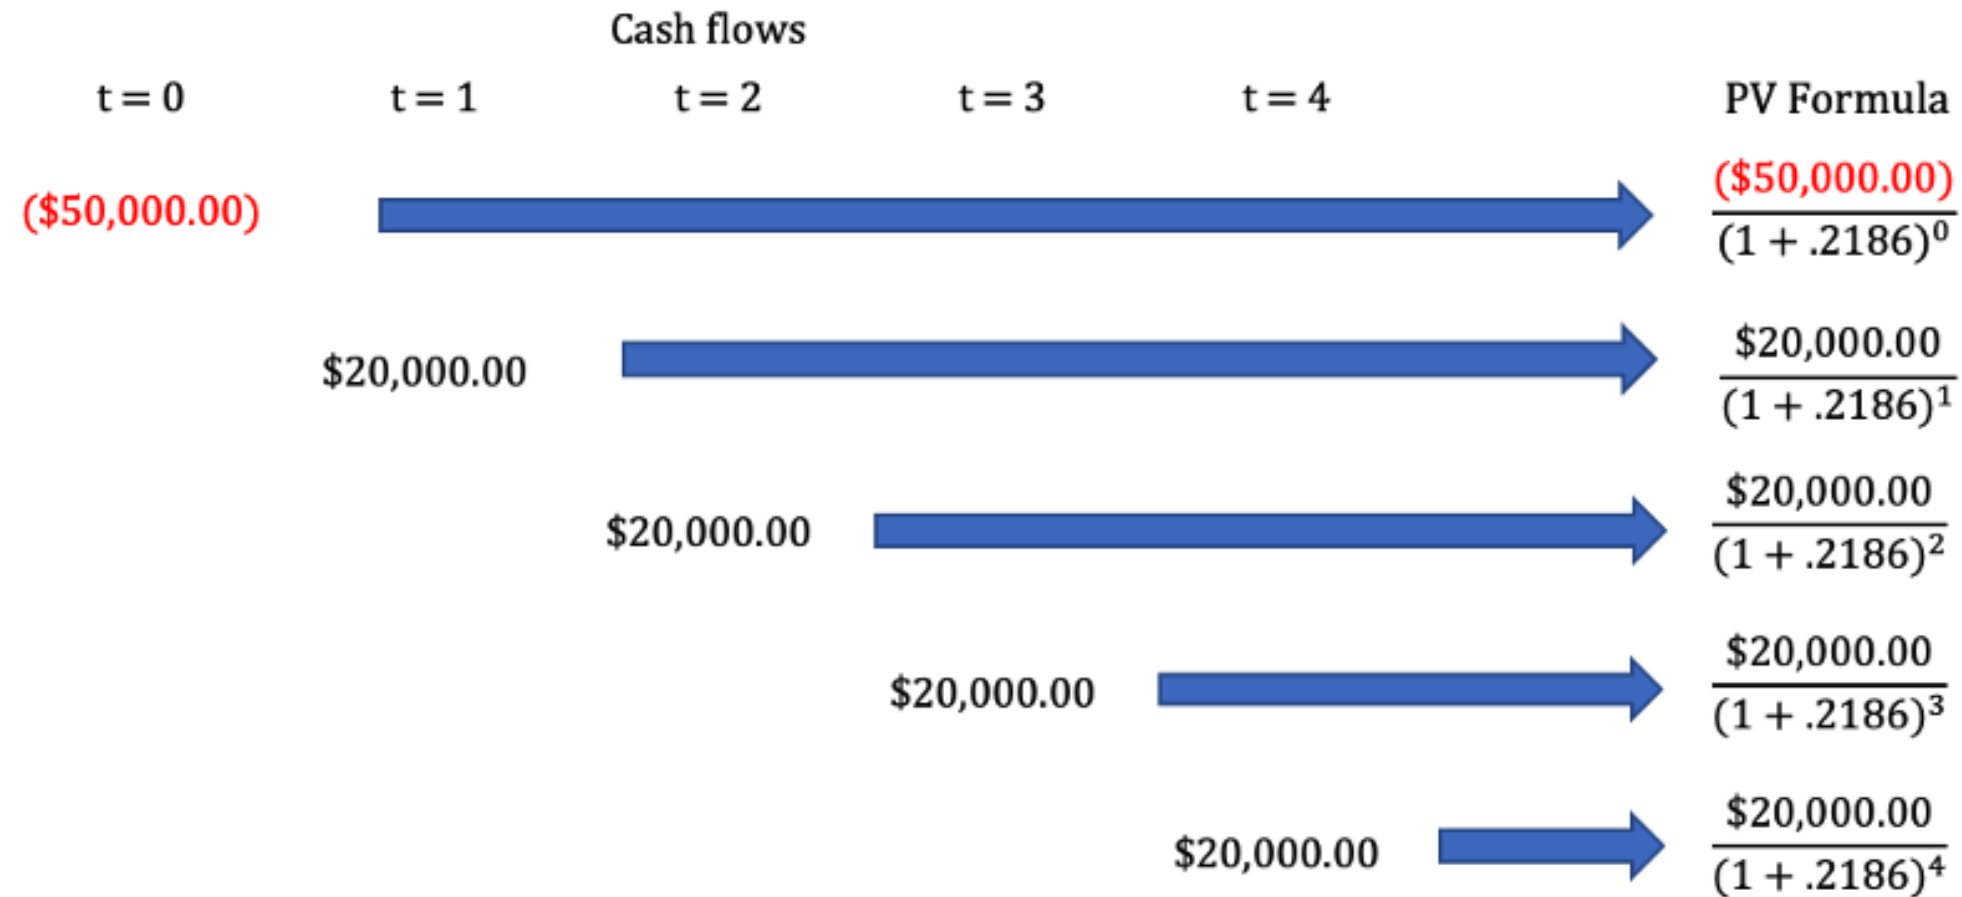

# Testing the IRR

Let's say **XIRR** gives us 21.86% for this cash flow...

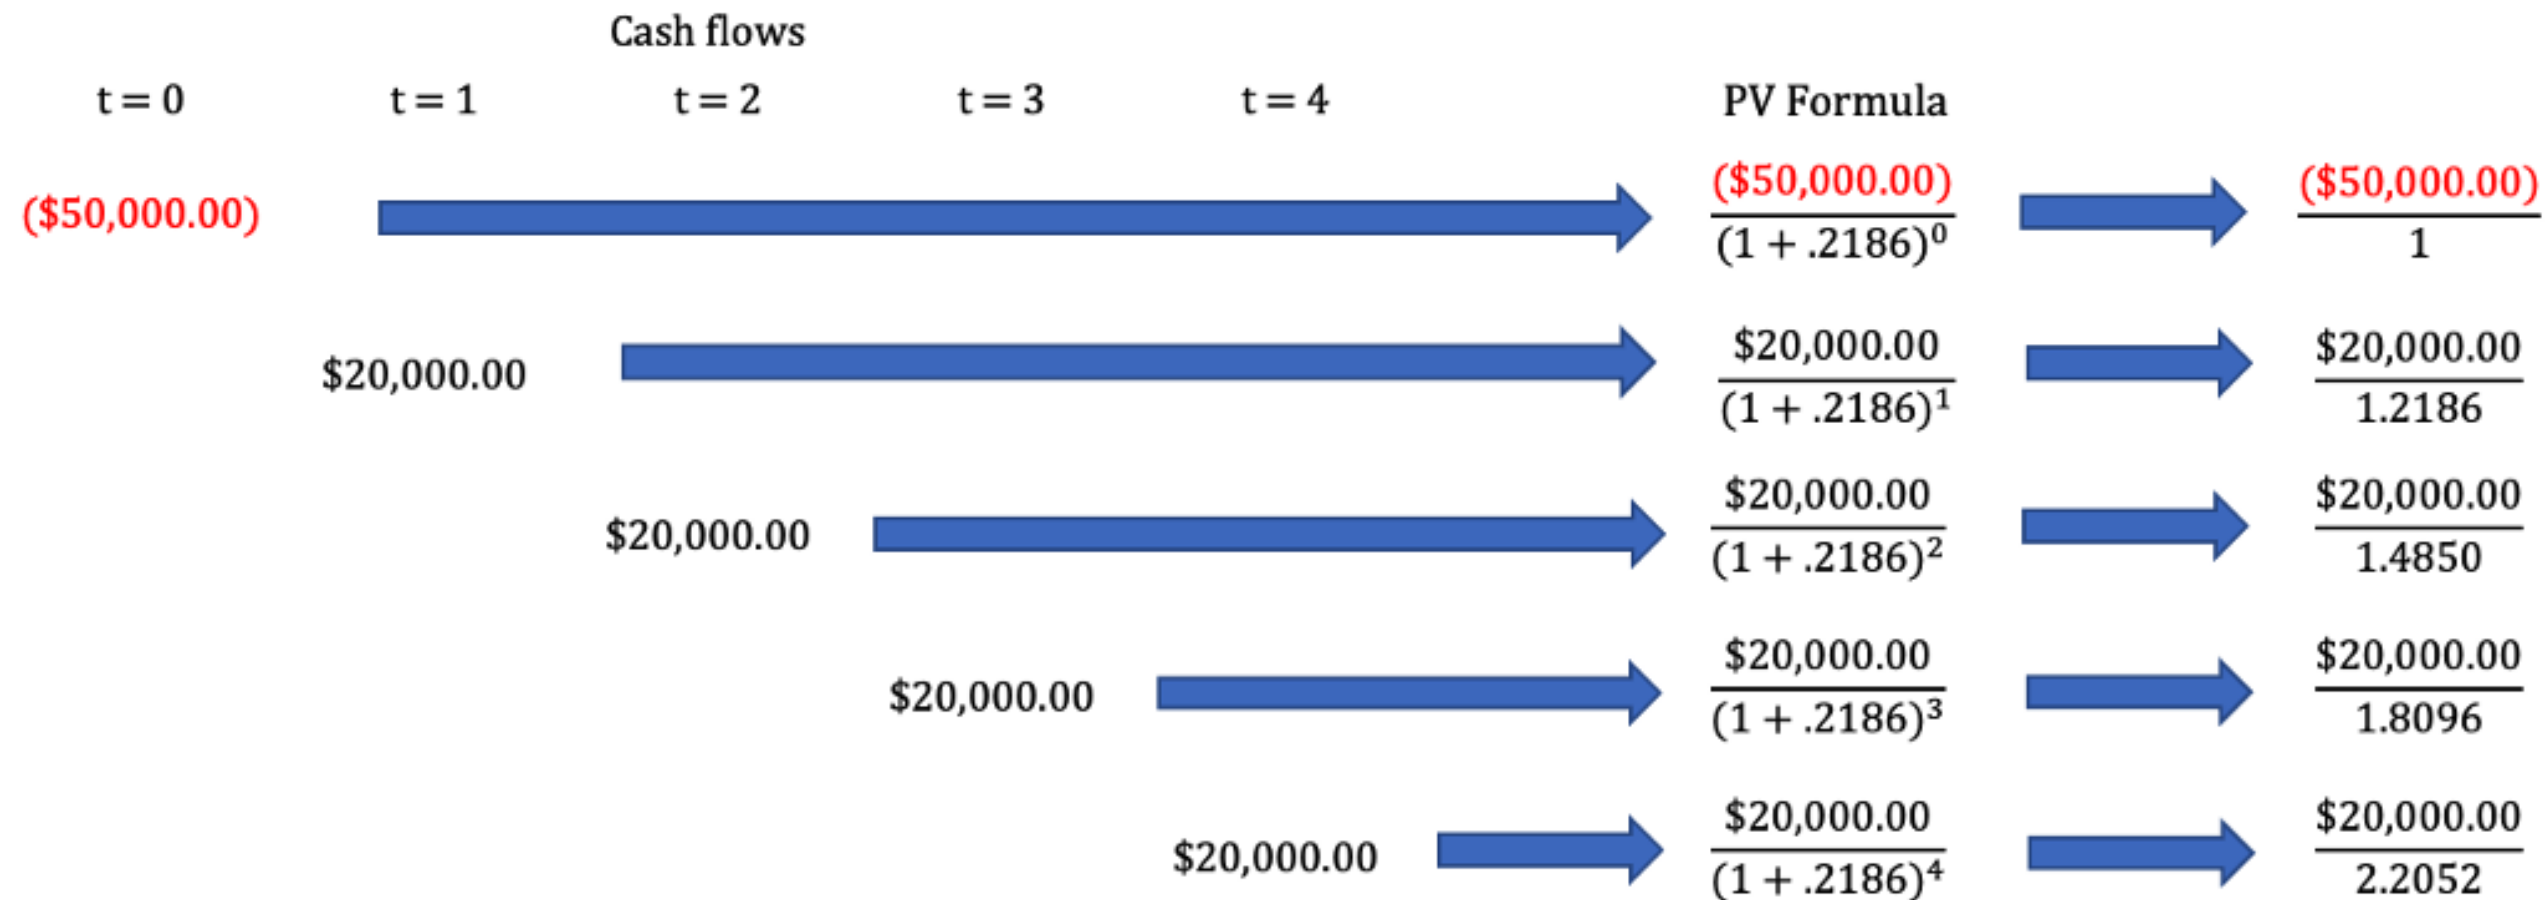

# Testing the IRR

Let's say **XIRR** gives us 21.86% for this cash flow...

# Testing the IRR

Let's say **XIRR** gives us 21.86% for this cash flow...

# Testing the IRR

Let's say XIRR gives us 21.86% for this cash flow...

Cash flows					PV Formula		Present Value
t = 0	t = 1	t = 2	t = 3	t = 4			
(\$50,000.00)					$\frac{(\$50,000.00)}{(1 + .2186)^0}$		$\frac{(\$50,000.00)}{1}$ (\$50,000.00)
	\$20,000.00				$\frac{\$20,000.00}{(1 + .2186)^1}$		$\frac{\$20,000.00}{1.2186}$ \$16,411.97
		\$20,000.00			$\frac{\$20,000.00}{(1 + .2186)^2}$		$\frac{\$20,000.00}{1.4850}$ \$13,467.64
			\$20,000.00		$\frac{\$20,000.00}{(1 + .2186)^3}$		$\frac{\$20,000.00}{1.8096}$ \$11,051.52
				\$20,000.00	$\frac{\$20,000.00}{(1 + .2186)^4}$		$\frac{\$20,000.00}{2.2052}$ \$9,068.87
							<hr/> \$0.00

# Making decisions with IRR

- A **hurdle rate** is the target return for an investment

## IRR investment criteria:

- If  $IRR > \text{the hurdle rate}$  then invest
- If  $IRR < \text{the hurdle rate}$  then don't invest
- Mutually exclusive projects:
  - Choose the project with **the highest net present value**
  - NPV represents a real dollar amount

**Example:** Your company has a hurdle rate of 10%. If the IRR is 7%, should they invest in the project?

**Answer:** No!  $IRR < \text{the hurdle rate}$ .

# Payback period

- The **break-even point** is the point where  $\text{initial investment} + \text{cash flows} = 0$ .
- **Payback period** is the time it takes to break even
  - Simple to understand, making it a popular metric
  - Does not consider the time value of money; no discounting of cash flows
  - Does not analyze profitability

<sup>1</sup> <https://www.investopedia.com/terms/p/paybackperiod.asp>

# Payback period

- The **break-even point** is the point where  $\text{initial investment} + \text{cash flows} = 0$ .
- **Payback period** is the time it takes to break-even.
  - Simple to understand, making it a popular metric
  - Does not consider the time value of money; no discounting of cash flows
  - Does not analyze profitability

## Discounted payback period

- Uses *discount cash flows* to find the length of time it takes break-even
  - Uses time value of money
  - More conservative since cash flows are discounted, it will take longer

<sup>1</sup> <https://www.investopedia.com/terms/p/paybackperiod.asp>

# Payback period

Period	0	1	2	3	4	Payback Period
CF	(5,000.00)	2,500.00	2,500.00	2,500.00	2,500.00	2
Discounted CF (10%)	(5,000.00)	2,272.73	2,066.12	1,878.29	1,707.53	3

# Payback period

Period	0	1	2	3	4	Payback Period
CF	(5,000.00)	2,500.00	2,500.00	2,500.00	2,500.00	2
Discounted CF (10%)	(5,000.00)	2,272.73	2,066.12	1,878.29	1,707.53	3

## Decision criteria

- **Investment horizon** is the length of time an investor wants to be invested in an asset.
  - If the payback period  $\leq$  the investment horizon, invest
  - If the payback period  $>$  the investment horizon, don't invest

# Chapter 1: Financial dashboards

- Reviewed the basics about dashboards and learned financial concepts
- Applied **Objective and Key Results (ORK)** frame work goal setting
- Used **artificial intelligence** to create impactful dashboard visuals
- Created a **forecast** using the *analytics pane*.

# Chapter 2: Scenarios and sensitivity analysis

- Used what-if parameters to run scenario analysis
- **Stress-tested** sales data and created **forecasts** with DAX
- Created a **scenario analysis** matrix to show the impact of various **input variables**

# Chapter 3: Time value of money

- Learned about the **time value of money** and **compounding**
- Performed **future value** and **present value** calculations by hand and with DAX
- Used `FV()` to create a **straight-line forecast**

# Chapter 4: Capital budgeting

- Learned about the importance of **capital budgeting** in financial analysis.
- Used **net present value**, **profitability index**, **internal rate of return**, and **payback period** to make sound investment decisions.
- Explored the impact of **discount rates** on **net present value**.
- Used **intermediate DAX** skills to create a **payback period** measure.
- Focused on creating an informative dashboard that could be shared.

# Best of luck!
